

In a combination of Greek and Latin the name realistically means ? Tear Crispy ? - Not very helpful, even if quite descriptive of the texture? So some common names are - Cauliflower Fungus, Wood Cauliflower, Brain Fungus - Any one of those will do!

I've foraged this in Yorkshire and eaten it. But it seems to be a bit of a bug magnet and is a bit of a pain to clean. These were from a local Chinese supermarket and were bug free and dried. Which made them much more appealing!

We soaked them in cold water for a couple of hours before quartering and cutting the dense central core out.

This was a stir-fry with home made Gluten Free battered Chicken (The Batter [recipe is here](#)) and Sue's home made Black Bean Sauce. ([Recipe here](#))

The Brain Fungus work just like a flavour sponge, absorbing and intensifying the sauce.
